

Model Output Value Feature Return

The EEP model produces the following output values: SAP ratings, Energy Use (KW per annum), CO2 Emissions (Kg per annum), CO2 Emissions in comparison to 1990 levels (Kg per annum)

Unique model output values are available at the polygon level (i.e. the individual building). It is these values that are aggregated to the Output Area level that provide the thematic spatial visualisation of each scenario.

Click on the Map Layer button and then on the Buildings Overlay:

To view the model output values at the household level simply click on the blue dot on an individual building. The thematic map layer can be toggled on and off.

Note: the Model Output Value Feature Return feature is available for larger scale mapping and will be disabled for small scale mapping layers

The energy variables available are generated from the EEP Domestic Model and as such data will not be returned for non-domestic buildings (such as hospitals, schools etc.)

Data is only available for those domestic buildings surveyed for the EEP Domestic model. Data for newly built houses may not be available and thus not viewable.
